

Python Tasks – Day12

1. Write a code to implement Number Guess Game constraints / Rules

you have 5 chance to guess correct number which is chosen by computer / friend

Range which is allowed to select a number 1-50

After each guess you should give some tips / hints to user to improve their chance of winning

for example if user guess a number which is higher than actual number you should say `hint: think a low number!

if user guess a number which is lower than actual number you should say `hint: think a big number!

if user wins we will show a congrats message and stop our game

if any time user guess is out of limit than print a warning message saying Think in Limits 1-50 only!

but we do not count this as a chance

2. Solve this problem <https://www.hackerrank.com/challenges/list-comprehensions/problem>
3. Solve this problem <https://www.hackerrank.com/challenges/python-lists/problem>
4. Solve this problem <https://www.hackerrank.com/challenges/finding-the-percentage/problem>
5. Write a program to sort a list without using inbuilt functions (list.sort not allowed)
 - a. Using **Bubble Sort** Algorithm
 - b. Using **Insertion Sort** Algorithm
 - c. Using **Selection Sort** Algorithm
