

Python Tasks – Day15

1. write output of this code

```
def extendList(val, list=[]):
```

```
    list.append(val)
```

```
    return list
```

```
list1 = extendList(10)
```

```
list2 = extendList(123,[])
```

```
list3 = extendList('a')
```

```
print("list1 = %s" % list1)
```

```
print("list2 = %s" % list2)
```

```
print("list3 = %s" % list3)
```

2. Write a function `reverse()` that inputs a number and return the reverse of that number, for example if input is 1293, function should return 3921.
3. Using the function `reverse()` in previous program, make a function `isPalindrome()` that inputs a number and checks whether it is a palindrome number. A number is palindrome number if it remains same after reversing its digits, for example 949, 82328 are palindrome.
4. Write a function `isprime()` which takes a number and returns 1 if the number is prime and 0 otherwise.
5. Write a function that inputs two numbers and prints all prime numbers between those numbers.
6. Write a program to raise a floating point number to an integer power(eg. a^n where a is floating point number and n is an integer value.)

Note: do not use `**` and `pow` built function of python for this purpose
